Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/763,391

Applicant(s)

NAKABAYASHI ET AL.

Examiner

Mohamed H. Ali

Art Unit

3693

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 January 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 26 January 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- 1) ☒ Certified copies of the priority documents have been received.
 - 2) ☐ Certified copies of the priority documents have been received in Application No. _____.
 - 3) ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date 1/26/2004 and 8/13/2004.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. **Claim 1-20** are rejected under 35 U.S.C. 103(a) as being unpatentable over ***Kawakami*** (4,769,532) in view of ***Zoladz*** (5,855,268).

As per claim 1, Kawakami discloses a sheet handling apparatus comprising:

a detection part (see col.4, lines 22-30; via controlling circuit **5**) that detects a characteristic of a sheet transported by a transport module;

an amplifier that amplifies a signal obtained from the detection part (see col.4, line 53, and **Fig.2 # 10**)

an A/D converter that converts an analog signal amplified in the amplifier to a digital signal (see col.4, line 52 and **Fig.2 #11**);

determining means that determine the truth of the sheet by use of a signal having been produced as a result of A/D conversion by the A/D converter (see col.4, lines 22-24 and **Figs 2 and 3 # 1**; via a CPU for controlling a bill discrimination device); and

a control part (See **Fig.2**; via CPU) that changes signal read accuracy of the detection part,

wherein, if the sheet is determined as unidentified as a result of determining the truth of the sheet in the determining means, the control part changes a setting of conditions so that a capability to determine the sheet is higher than when the sheet was determined as unidentified, and transports the sheet determined as unidentified to the detection part so that the truth determination is performed again in the determining means (**CPU**- inherently does all operations).

However, *Kawakami* fails to teach details about the sheet (bill) transported by a transport module.

Zoladz in the same field of invention discloses the concept of bill (sheet) transported past a plurality of photosensors and phototransistors (see col.1 and 3, lines 15-20, 10-50, and **Fig.1**; via transport unit **1** connected to a bill stacker **2** and cashbox **5**).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention was made to modify the transport module to include a currency validator and transport **unit 1** in order to facilitate the complete process of validation and denomination of paper currency or bill (sheet).

As per claims **2** and **3**, *Kawakami* discloses the control part changes an amplification factor of the amplifier corresponding to denominations (see col.6, lines 24-65, and **Figs.5** and **6**; via CPU, amplifier **10** and amplification factor).

As per claims 4 and 5, Kawakami discloses that the control part changes and sets conditions to narrow a range between an input upper limit value and an input lower limit value of the A/D converter (see col.6, lines 50-58; via function of A/D converter **11**. and CPU with control part).

As per claim 6, Kawakami discloses sheets determined as unidentified by the determining means include sheets in which characteristics indispensable to true bills were detected but which exceed a permissible error.

As per claim 7, Kawakami discloses a method of determining bills in a bill handling apparatus, comprising the steps of:

 sending a bill to a determining part to perform determination (see col.6, line 25 and CPU controlling apparatus);

 detecting characteristics of the bill by a detection part (**Fig.2 # 5**);

 processing a signal from the detection part (**Fig.5**; via **5, 6, 10, 11, 12 to CPU 1**) and determining a denomination and truth of the bill (see col.4, line 23, **Fig.2**, CPU controlling bill discrimination device);

 as a result of the truth determination, classifying the bill into one of at least four types of bills to process the bill, the four types of bills being true bills determined as true, false bills lacking characteristics indispensable to true bills, unidentified bills having characteristics indispensable to true bills but exceeding a permissible error thereof, and undefined bills the denominations of which cannot be determined (see **Figs 5-10**; col.4, lines 23-65 and CPU, inherently programmed);

if the bill is determined as an unidentified bill, changing an amplification factor or resolution of the detection part so as to increase accuracy to determine the bill; and after the change, sending the unidentified bill to the determining part again to detect the characteristics of the bill in the detection part (see **Figs 5-10**; col.4, lines 23-65 and CPU, inherently programmed).

As per claim 8, Kawakami discloses that the changing step changes an input range of the A/D converter (see col. 6 lines 50-60).

As per claim 9, Kawakami discloses that, as a result of the truth determination, an undefined bill is returned to a user, a bill determined as an unidentified bill and a bill determined as a false bill in another determination are stored in the machine, and a bill determined as an undefined bill in yet another determination is returned to the user (CPU inherently programmed and determines the bill false or true and transport accordingly).

As per claim 10, Kawakami, discloses that. a sheet handling apparatus, comprising:

a determining part (see col.4, lines 22-30; via controlling circuit **5**) that determines the truth of sheets transported by a transport module;

a control part (**Fig.2.** with control circuit # **5**) that changes accuracy to determine the sheets in the determining part.

However, **Kawakami** fails to teach about a stocking part that temporary holds sheets determined as unidentified in the determining part, wherein, if the sheets are determined as unidentified in the determining part, the control part changes a

determination condition so as to increase the determination accuracy of the determining part, and transports the sheets determined as unidentified to the determining part again to determine the truth of the sheets.

Zoladz in the same field of invention discloses the concept of after validation storage of bill in a currency cashbox **4** (see col.3, lines 10-55).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention was made to modify the concept of storing bills after validation in the currency cashbox in order to facilitate to handle paper (sheet) currency as quickly as possible.

As per claim 11, Kawakami discloses the determining part comprises:

a detector that detects a characteristic of a sheet, an amplifier that amplifies a signal obtained from the detector, an A/D converter that converts an analog signal amplified in the amplifier to a digital signal; and determining means that determine the truth of the sheets by use of a signal produced as a result of A/D conversion by the A/D converter (see **Fig. 2**; via **# 5, 6, 9, 10** and **11**),

wherein, if the sheet is determined as unidentified in the determining part, the control part changes signal read accuracy of the detector so as to increase a capability to determine the sheet, and transports the sheet determined as unidentified to the detector to again determine the truth of the sheet in the determining means (see **Fig.2** and CPU **# 1**).

Claims 12 and 13 are rejected as per reasons set forth in claim **10**.

Claim 14 is rejected as per the reasons set forth in claim **2**.

Claim 15 is rejected as per the reasons set forth in claim 4

As per claim 16, Kawakami discloses a method of determining bills in a bill handling apparatus, comprising:

a first determination mode in which denominations and truth of the bills are determined with first determination accuracy in the determining part (see **Figs.5, 6 and 7**; via determination steps);

setting second determination accuracy as higher bill determination accuracy if a bill is determined as an unidentified bill as a result of determination in the first determination mode (see **Figs.5-10** via CPU inherently doing all the steps);

a second determination mode in which a bill determined as unidentified as a result of the first determination in the determining part set at the second determination accuracy is determined again (see **Figs.5-10**; via CPU inherently doing steps as programmed); and

processing bills determined as unidentified or false bills as a result of determination in the second determination mode separately from other bills (see **Figs.5-10**; via CPU inherently doing as programmed).

However, **Kawakami** fails to disclose about transporting bills to a determining part to perform determination.

Zoladz in the same field of invention discloses the transport system 1 with entryway 8 for transporting bills to currency validator (see col.3, lines 35-50).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention was made to modify the transporting bills to a determining part to

include the insertion of banknote in to currency validator to facilitate the entry by gripping between belts and wheels by sensors and motor (col.3, lines 35-45)

As per claim 17, Kawakami discloses that the first determination mode includes the steps of:

detecting the characteristics of the bills by a detector; and processing a signal from the detector to determine the truth of the bills (see **Figs.5, 6 and 7**; via determination steps);

As per claim 18, Kawakami discloses the setting accuracy so as to increase the amplification factor or resolution of the detector for detecting the characteristics of the bills in the second determination mode (see **Figs.5-10**; via CPU inherently doing steps as programmed); and

As per claim 19, Kawakami discloses the step of storing information about sheets determined as false bills or unidentified bills in the second determination mode in a storing part in association with information capable of identifying users of the bills (see **Figs.5-10**; via CPU inherently doing steps as programmed).

As per claim 20, Kawakami discloses further the step of having users confirm an inputted amount if a bill is determined as an unidentified bill as a result of determining the bill in the first determination mode (see **Figs.5-10**; via CPU inherently doing as programmed).

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Fujita (5,836,435) discloses Bill Handling Apparatus for validating Bills and Banknotes.

Hutchinson (6,070,710) discloses Method and Apparatus for Banlnote Validation

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mohamed H. Ali whose telephone number is 571-270-3021. The examiner can normally be reached on 8.00 to 5.30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Kramer can be reached on 571-272-6783. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
